

The Non- Surgical Eye Lift treatment

With Plasma BT
Surgical™ Technology

Plasma BT Surgical™ uses advanced atmospheric pressure plasma technology to safely, accurately and superficially treat the skin.

Now you can have satisfying results for various areas of concern without surgery and without undertaking ablative laser procedures.

This treatment tightens skin and stimulates fibroblast and collagen production.

Typical treatments include...

- Non- surgical upper eyelid rejuvenation, lifting and tightening
- Non- surgical lower eyelid rejuvenation lifting and tightening
- Crows feet reduction
- Wrinkle reduction on face, upper lip, umbilicus etc
- Reduction of acne scarring, other scarring
- Removal of skin tags, treatment of acne cysts/ spots
- Non-surgical neck lift

A non- invasive eyelid procedure without any surgical incision, no hospital stay and no general anaesthetic.

A walk – in walk out procedure performed under local anaesthetic.

Safe and effective treatment for the delicate eye area.

Some skin types may not be suitable.

Frequently asked questions

What is Plasma?

Plasma is one of the four fundamental states of matter, and was first described by chemist Irving Langmuir in the 1920s. In our situation the Plasma BT Surgical™ turns the gases in the air into an ionized gas consisting of positive ions and free electrons – this is Plasma.

How does Plasma work on the skin?

Plasma works to create ionizing gas from the environmental gases and so, in an extremely localised and safe manner, stimulates the skin. There is immediate tightening. As the skin heals it develops first type 3 collagen and later type 1 collagen. The result is thicker, tightened and more youthful skin.

How do the results compare to eyelid/ eyebag surgery?

Each person has an individual response. The results can be modest or as good as surgery.

Is there any pain?

A powerful local anaesthetic cream is applied and other support measures are available. Most people tolerate the 10 minute procedure very well and rate the pain at 1-3 out of 10.

Is there any recovery time?

You can return to normal activities immediately. However, the delicate eye area can swell for 2-3 days – this can be treated by medication. The small brown ‘dots’ on the skin that are part of the treatment fall off in 5-7 days.

If your everyday appearance is important to you, then consider around 5 days of social down time.

How many treatments are needed?

A result is seen immediately. For long lasting results, 3 treatments are recommended, several weeks apart - it takes time for the collagen to fully remodel.

Can it treat acne scars?

Yes. This treatment would be part of a full Acne scar reduction programme involving other treatments in the clinic as well. This treatment may reduce the need for a procedure called Subcision whereby a needle would be placed under the skin to cut tethered scar tissue.

What about upper lip lines?

Plasma BT surgical™ can be a very satisfying treatment™ for these lines. A fractionated or ablative laser would be associated with 1-3 weeks down time. Instead, this procedure can be performed under a numbing injection and carries with it a shorter down time.

What about other scars? Around the umbilicus, crows feet, and other facial or body scars. Skin tags and sun damage spots.
